

Idea Generation Declaration

Project Name: Roommate Dashboard

Document ID: Declaration

Control Label: D0-v1-r1

Date: 2/4/2026

Prepared By: Group 6

Vision:

The vision of the Roommate Dashboard project is to make living with roommates easier and less stressful by providing one shared system to manage bills, chores, and groceries. The system will improve fairness, communication, and organization within a household.

Mission:

The mission of the Roommate Dashboard is to provide roommates with a simple dashboard that helps them split shared bills, assign and track chores, and maintain a shared grocery list. The system will allow roommates to see household responsibilities clearly and reduce conflict caused by miscommunication.

Idea:

The Roommate Dashboard is a web-based application that allows roommates living in the same household to manage shared responsibilities in one place. The system will allow users to create a household, invite roommates, split bills, track payment status, assign chores, rotate chores, and manage a shared grocery list.

Questions:

1. Is it feasible?

Yes. The project is feasible because it can be built using standard web technologies such as HTML, CSS, JavaScript, Python Flask, and SQLite. These tools are accessible and appropriate for a student software engineering project.

2. Does it add value?

Yes. Many roommates experience conflict due to forgotten bills, unfair chores, and unclear grocery responsibilities. This system adds value by organizing these responsibilities in one shared dashboard.

3. Can it be monetized?

Yes. The system can be monetized through a freemium model. The free version could provide basic tracking, and a paid version could include premium features such as reminders, exporting reports, and payment integrations.

4. Is it secure?

Yes. The system will use user authentication and household access control so only members of the household can access household data. Passwords will be securely stored and the system will avoid exposing private information.
